

Lab 09: Monitoring Governance

Lab 09: Monitoring, Administration, and Governance

Lab summary

These labs teach operational monitoring and governance practices for deployed Power BI content.

Novice-friendly how-to guide

Review usage metrics

1. Open the report in the Power BI Service.
2. Look for the usage metrics option if it is available in the tenant.
3. Review views, viewers, and recent activity.
4. Record what the report owner should monitor.
5. If usage metrics are unavailable, document the tenant, license, or permission blocker.

Review refresh history

1. Open the workspace.
2. Select the semantic model.
3. Open refresh history or settings.
4. Record recent success/failure status.
5. For failures, capture the error summary and likely next action.

Azure Government readiness

Usage metrics and refresh history are generally **Gov-ready**, subject to permissions and tenant policy. Activity logs, audit logs, admin monitoring workspace, capacity metrics, Purview, and DLP are **Verify for Gov**.

Prerequisites

- Power BI Service workspace with deployed content.
- Access to semantic model refresh history.
- Optional Power BI/Fabric admin role.
- Optional gateway admin access.
- Optional capacity admin access.
- Optional Purview/DLP access.

Exercise 1: Usage metrics

Objective: Interpret report adoption and usage.

Tasks

1. Open usage metrics for a report or App.
2. Review views and unique viewers.
3. Identify high-use and low-use pages.
4. Document adoption observations.
5. Identify one follow-up action.

Expected result

Learners can interpret usage data and connect it to support or adoption actions.

Concept note: Adoption tracking

Adoption tracking connects usage patterns to action. When usage is high, document training and support needs so the solution remains reliable. When usage is low or declining, identify whether users need enablement, the content is hard to find, or the report is a retirement candidate.

Exercise 2: Refresh troubleshooting

Objective: Diagnose semantic model refresh issues.

Tasks

1. Open semantic model refresh history.
2. Review the most recent refresh status.
3. Inspect failure details if present.
4. Review data source credentials.
5. Review gateway mapping if applicable.
6. Document likely cause and next action.

Expected result

Learners can follow a structured refresh troubleshooting process.

Exercise 3: Tenant setting review

Objective: Understand tenant settings that affect governance.

Tasks

1. Review sharing-related settings.
2. Review export-related settings.
3. Review publish-to-web controls.
4. Review certification and endorsement settings.
5. Review external user settings.
6. Document settings that require customer policy decisions.

Expected result

Learners understand how tenant settings influence risk and user experience.

Exercise 4: Gateway monitoring

Azure Government note: Gateway monitoring is **Verify for Gov**. Validate gateway access, network path, version, data source, and tenant policy.

Objective: Review gateway health and mappings.

Tasks when available

1. Review gateway cluster status.
2. Review data source mappings.
3. Review credential configuration.
4. Review gateway version.
5. Document support owner and escalation path.

Alternate path

Use the operations runbook template to document gateway requirements conceptually.

Optional lab: Activity logs

Azure Government note: Activity logs and audit logs are **Verify for Gov**. Validate admin permissions, audit configuration, and cloud support.

Objective: Understand audit evidence.

Tasks when available

1. Identify an activity to investigate.
2. Query or review activity log data.
3. Identify actor, action, workspace, item, and timestamp.
4. Document how logs support governance.

Optional lab: Admin monitoring workspace

Azure Government note: Admin monitoring workspace is **Verify for Gov**. Validate availability in the target tenant.

Objective: Review tenant-level monitoring.

Tasks when available

1. Open the admin monitoring workspace.
2. Review available reports.
3. Identify tenant-level adoption or governance indicators.
4. Document follow-up actions.

Optional lab: Capacity metrics app

Azure Government note: Capacity metrics app is **Verify for Gov**. Validate capacity type, role, app availability, and telemetry.

Objective: Interpret capacity health.

Tasks when available

1. Open the capacity metrics app.
2. Review CPU and memory indicators.
3. Review refresh workload.
4. Identify throttling or overload signals.
5. Document capacity follow-up actions.

Optional lab: Purview and DLP review

Azure Government note: Purview and DLP are **Verify for Gov**. Validate M365/Purview cloud, labels, licensing, policies, and tenant configuration.

Objective: Understand compliance integration.

Tasks when available

1. Review sensitivity label availability.
2. Review DLP policy scope.
3. Review export and sharing behavior.
4. Document compliance requirements.

Exercise 5: Operations runbook

Objective: Create a support-ready runbook.

Tasks

1. Complete content inventory.
2. Document data sources and refresh.
3. Document access and governance.
4. Document monitoring cadence.
5. Document incident response paths.
6. Add Azure Government validation notes.

Expected result

Learners produce a draft operations runbook for the deployed solution.

Validation checklist

- ☐ Usage metrics reviewed or conceptually documented.
- ☐ Adoption follow-up, training need, support signal, or retirement candidate documented.
- ☐ Refresh troubleshooting process documented.
- ☐ Tenant settings review completed or conceptually documented.
- ☐ Gateway monitoring marked **Verify for Gov.**
- ☐ Activity/audit logs marked **Verify for Gov.**
- ☐ Admin monitoring workspace marked **Verify for Gov.**
- ☐ Capacity metrics marked **Verify for Gov.**
- ☐ Purview and DLP marked **Verify for Gov.**
- ☐ Operations runbook draft completed.
